

The focus of the survey is Gray whales (northbound) during migration. We record sighting data for all cetaceans (in our survey: whales and dolphins), including a distinguishing tally of Gray whales (southbound) and Humpback whales. Occasionally, we are fortunate to observe other whale species, including Blue, Fin, and Minke whales; and, if we are not able to identify the species, the sighting species is entered as “unidentified large whale.” Because we track northbound Gray whales for extended periods of time, over multiple surfacings, we are able to determine the number of whales sighted with a high degree of confidence. Other whales do not receive as much attention.

Common dolphins and Pacific White-sided dolphins are usually in groups of too many dolphins, too far away, and traveling too fast for an absolute determination of group size. We fall back on experience and enter a “best guess,” and we are not able to determine the number of calves: total calves are entered as Not Determined (zero in calculations). And, it is not only dolphins that are sometimes spotted too far away to be identified. We “found” quite a few unidentified large whales, some of which we thought might be a Minke whale (rare for us). Then, when we did ID a Minke, we now are not-so-sure. It might have been a rarer Bryde’s whale. However, it will remain a Minke, our best guess at the time.

Note: Of the species sighted, only Gray whales (north and southbound) are migrating past the Point. Their tallies indicate the number of unique animals observed through the survey. All other cetaceans, pinnipeds, and Sea otters (the subjects of other reports) were possibly sighted multiple times during a day and likely seen over and over on different days as the survey progressed. The tallies of these species represent the number of animals (not necessarily unique) documented at sightings each day.
